

Kaan Eren Yuvuz Homework-2 090200368

1-) Let S be a parametrized surface given by parametrization
 $\vec{r}(u,v) = (\cos u \sin v, \sin u \sin v, \cos v)$ $0 \leq u < 2\pi, 0 \leq v < \pi$

a) Find coefficients of first fundamental and second fund. forms of the surface S .

b) Find the Gaussian and Mean curvature of the surface S .

c) Find umbilical points of S .

d) Determine hyperbolic, elliptic, and parabolic points of surface S .

e) Find the asymptotic lines.

$$a) \vec{r}_u = (-\sin u \sin v, \cos u \sin v, 0), \vec{r}_v = (\cos u \cos v, \sin u \cos v, -\sin v)$$

$$E = \sin^2 v \sin^2 v \cos^2 u \sin^2 v = \sin^2 v, G = \cos^2 u \cos^2 v + \sin^2 u \cos^2 v + \sin^2 v = 1$$

$$F = -\sin u \sin v \cos u \cos v + \cos u \sin v \sin u \cos v = 0$$

$$\vec{N} = \frac{\vec{r}_u \times \vec{r}_v}{|\vec{r}_u \times \vec{r}_v|} \Rightarrow \vec{r}_u \times \vec{r}_v = \begin{vmatrix} \vec{i} & \vec{j} & \vec{k} \\ -\sin u \sin v & \cos u \sin v & 0 \\ \cos u \cos v & \sin u \cos v & -\sin v \end{vmatrix} = \begin{pmatrix} \cos v \sin^2 v \\ -\sin v \sin^2 v \sin u \\ \sin^2 v \sin u \cos v - \cos^2 u \sin v \cos v \end{pmatrix}$$

$$\vec{r}_u \times \vec{r}_v = \begin{pmatrix} \cos v \sin^2 v \\ -\sin v \sin^2 v \sin u \\ \sin^2 v \sin u \cos v - \cos^2 u \sin v \cos v \end{pmatrix}$$

$$|\vec{r}_u \times \vec{r}_v| = \sqrt{\cos^2 v \sin^4 v + \sin^4 v \sin^2 v + \sin^2 v \cos^2 v} = \sqrt{\sin^4 v + \sin^2 v \cos^2 v}$$

$$= \sqrt{\sin^2 v (\sin^2 v + \cos^2 v)} = \sin v$$

$$\vec{N} = (-\cos u \sin v, -\sin u \sin v, -\cos v)$$

$$\vec{r}_{uu} = (-\cos u \sin v, -\sin u \sin v, 0), \vec{r}_{uv} = (-\cos u \cos v, -\sin u \cos v, -\cos v)$$

$$\vec{r}_{vu} = (-\sin u \cos v, \cos u \cos v, 0)$$

$$e = \langle \vec{N}, \vec{r}_{uu} \rangle = \cos u^2 \sin^2 v \sin^2 v \sin^2 v = \sin^2 v$$

$$f = \langle \vec{N}, \vec{r}_{uv} \rangle = \cos u \sin u \cos v \sin v - \sin u \sin u \cos v \cos v = 0$$

$$g = \langle \vec{N}, \vec{r}_{vv} \rangle = \cos^2 v \sin^2 v + \sin^2 v \sin^2 v + \cos^2 v = 1$$

b) $K = \frac{eg - f^2}{EG - F^2} = \frac{\sin^2 v}{\sin^2 v} = 1 > 0$ ($K = \det(d\vec{N}_p) = k_1 \cdot k_2$)
 Gauss curv. principal curvatures

$$\det(d\vec{N}_p) = \det \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} = a_{11}a_{22} - a_{12}a_{21}$$

$H = -\frac{1}{2} \text{trace}(d\vec{N}_p) = -\frac{1}{2}(a_{11} + a_{22}) = -\frac{1}{2} \left[\frac{fF - eG}{EG - F^2} + \frac{fF - gE}{EG - F^2} \right]$
 Mean curv.

$$H = \frac{1}{2} \left(\frac{gE - 2fF + eG}{EG - F^2} \right) = \frac{1}{2} \left(\frac{\sin^2 v + \sin^2 v}{\sin^2 v} \right) = \frac{1}{2}(2) = 1$$

c) If $k_1 = k_2$ at the point p , then p is called an umbilical point and principal curvatures hold the equation.

$$k^2 - 2Hk + K = 0$$

$$k^2 - 2 \left(\frac{Eg - 2fF + eG}{EG - F^2} \right) k + \frac{eg - f^2}{EG - F^2} = 0$$

$$(EG - F^2)k^2 - (Eg - 2fF + eG)k + (eg - f^2) = 0$$

$$\sin^2 v k^2 - 2\sin^2 v k + \sin^2 v = 0$$

$$\begin{array}{l} k^2 - 2k + 1 = 0 \\ k \quad -1 \\ k \quad -1 \end{array}$$

$k_1 = k_2 = 1$ principal curvatures equal each other

d) Since the Gaussian curvature K of the surface $\vec{x}(u, v)$ is positive ($K = 1 > 0$) then all points are elliptic.

e) $\Pi_p = 0 \Rightarrow e(du)^2 + 2f du dv + g(dv)^2 = 0$

$$\sin^2 v (du)^2 + dv^2 = 0$$

$$\left(\frac{du}{dv} \right)^2 = -\frac{1}{\sin^2 v}$$

$$\int du = -\int \frac{dv}{\sin v}$$

$$u = -\int \csc v dv$$

$$u = -(-\ln |\csc v + \cot v| + C) \quad u = \ln |\csc v + \cot v| + C$$

$$2) \vec{r}(t, v) = (t+v, t-v, 4tv+t+1)$$

a) Show that the surface \vec{r} is a ruled surface

b) Find the line of striction of the ruled surface \vec{r} .

c) Find the distribution parameter of \vec{r} .

$$a) \vec{r}(t, v) = (t+v, t-v, 4tv+t+1)$$

$$= (t, t, t+1) + v(1, -1, 4t)$$

$$= \vec{\alpha}(t) + v \cdot \vec{\omega}(t) \quad \text{where } \vec{\alpha}(t) = (t, t, t+1) \text{ and}$$

$\vec{\omega}(t) = (1, -1, 4t)$. Thus, $\vec{r}(t, v)$ is a ruled surface generated by the family $\{\vec{\alpha}(t), \vec{\omega}(t)\}$

$$b) \vec{\beta}(t) = \vec{\alpha}(t) - \frac{\langle \vec{\alpha}', \vec{\omega}' \rangle}{\langle \vec{\omega}', \vec{\omega}' \rangle} \vec{\omega}(t)$$

We already know $\vec{\alpha}(t), \vec{\omega}(t)$

$$\vec{\alpha}'(t) = (1, 1, 1), \quad \vec{\omega}'(t) = (0, 0, 4)$$

$$v(t) = - \frac{(1, 1, 1) \cdot (0, 0, 4)}{|(0, 0, 4)|^2} = - \frac{4}{16} = - \frac{1}{4}$$

$$\vec{\beta}(t) = \vec{\alpha}(t) - \frac{\langle \vec{\alpha}', \vec{\omega}' \rangle}{\langle \vec{\omega}', \vec{\omega}' \rangle} \vec{\omega}(t) = (t, t, t+1) + \frac{1}{4}(1, -1, 4t)$$

$$\vec{\beta}(t) = \left(t + \frac{1}{4}, t - \frac{1}{4}, 2t+1\right)$$

$$c) \lambda = \frac{(\vec{\beta}', \vec{\omega}, \vec{\omega}')}{|\vec{\omega}|^2} \quad (\vec{\beta}', \vec{\omega}, \vec{\omega}') = \begin{vmatrix} t + \frac{1}{4} & t - \frac{1}{4} & 2t+1 \\ 1 & -1 & 4t \\ 0 & 0 & 4 \end{vmatrix}$$

$$= \left(t + \frac{1}{4}\right)(-4) - \left(t - \frac{1}{4}\right)(4) + (2t+1)(0)$$

$$= -4t - 1 - 4t + 1 = -8t$$

$$|\vec{\omega}'|^2 = 16$$

$$\lambda = -\frac{t}{2}$$

3) Let $U = \{(u, v) \in \mathbb{R}^2 \mid u > 0, 0 \leq v < 2\pi, |a| < 1\}$

Let S and \bar{S} be two parametrized surfaces, respectively given by

$\vec{r}: U \rightarrow S = \vec{r}(u)$, $\vec{r}(u, v) = (u \cos v, u \sin v, u)$ and $\vec{r}^*: U \rightarrow \bar{S} = \vec{r}^*(u)$

$\vec{r}^*(u, v) = (a \cos(\frac{v}{a}), a \sin(\frac{v}{a}), \sqrt{1-a^2} u)$ Show that S and \bar{S} are locally isometric

$$\vec{r}_u = (\cos v, \sin v, 1), \quad \vec{r}_v = (-u \sin v, u \cos v, 0)$$

$$E = 1, \quad F = 0, \quad G = u^2 \sin^2 v + u^2 \cos^2 v = u^2$$

$$\vec{r}_u^* = (a \cos(\frac{v}{a}), a \sin(\frac{v}{a}), \sqrt{1-a^2})$$

$$\vec{r}_v^* = (-u \sin(\frac{v}{a}), u \cos(\frac{v}{a}), 0)$$

$$E^* = a^2 + 1 - a^2 = 1, \quad F^* = 0, \quad G^* = u^2 \sin^2(\frac{v}{a}) + u^2 \cos^2(\frac{v}{a}) = u^2$$

Since $E = E^* = 1$, $F = F^* = 0$, $G = G^* = u^2$ then S and \bar{S} are locally isometric.

4.) Let $\vec{r} = \vec{r}(u, v)$ be a regular parametrized surface and assume that \vec{r} is isothermal. Then prove that $\vec{r}_{uu} + \vec{r}_{vv} = 2\lambda^2 H \vec{N}$ where $\lambda^2 = \langle \vec{r}_u, \vec{r}_u \rangle = \langle \vec{r}_v, \vec{r}_v \rangle$, and H is mean curv. of the surface.

• Theorem. Let $\vec{r} = \vec{r}(u, v)$ be a parametrized surface and assume that \vec{r} is isothermal.

$$\text{Then } \vec{r}_{uu} + \vec{r}_{vv} = 2\lambda^2 \vec{H}, \quad \vec{H} = H \vec{N}$$

Proof: By the isothermal parametrization

$$\underbrace{\langle \vec{r}_u, \vec{r}_u \rangle}_E = \underbrace{\langle \vec{r}_v, \vec{r}_v \rangle}_G; \quad \underbrace{\langle \vec{r}_u, \vec{r}_v \rangle}_F = 0$$

$$E = G.$$

$$\frac{\partial}{\partial v} \langle \vec{r}_u, \vec{r}_u \rangle = \frac{\partial}{\partial v} \langle \vec{r}_v, \vec{r}_v \rangle$$

$$\langle \vec{r}_{uv}, \vec{r}_u \rangle + \langle \vec{r}_u, \vec{r}_{uv} \rangle = \langle \vec{r}_{vu}, \vec{r}_v \rangle + \langle \vec{r}_v, \vec{r}_{vu} \rangle$$

$$2 \langle \vec{r}_{uv}, \vec{r}_u \rangle = 2 \langle \vec{r}_{vu}, \vec{r}_v \rangle \quad (1)$$

$$F = \langle \vec{r}_u, \vec{r}_v \rangle = 0$$

$$\frac{\partial}{\partial v} \langle \vec{r}_u, \vec{r}_v \rangle = \langle \vec{r}_{uv}, \vec{r}_v \rangle + \langle \vec{r}_u, \vec{r}_{vv} \rangle = 0$$

$$\langle \vec{r}_{uv}, \vec{r}_v \rangle = - \langle \vec{r}_u, \vec{r}_{vv} \rangle \quad (2)$$

$$\text{From 1 and 2} \Rightarrow \langle \vec{r}_{uv}, \vec{r}_u \rangle = \langle \vec{r}_{vu}, \vec{r}_v \rangle = - \langle \vec{r}_{vv}, \vec{r}_u \rangle$$

$$\Rightarrow \langle \vec{r}_{uv} + \vec{r}_{vv}, \vec{r}_u \rangle = 0 \quad (3)$$

$$\langle \vec{x}_u, \vec{x}_u \rangle = \langle \vec{x}_v, \vec{x}_v \rangle$$

$$\frac{\partial}{\partial v} \langle \vec{x}_u, \vec{x}_u \rangle = \frac{\partial}{\partial v} \langle \vec{x}_u, \vec{x}_v \rangle$$

$$\Rightarrow 2 \langle \vec{x}_{uv}, \vec{x}_u \rangle = 2 \langle \vec{x}_{uv}, \vec{x}_v \rangle \quad (4)$$

$$F = \langle \vec{x}_u, \vec{x}_v \rangle = 0 \Rightarrow \frac{\partial}{\partial v} \langle \vec{x}_u, \vec{x}_u \rangle = 0 \quad \langle \vec{x}_{uv}, \vec{x}_v \rangle = -\langle \vec{x}_u, \vec{x}_{vv} \rangle$$

From 4 and 5

$$\Rightarrow \langle \vec{x}_{uv}, \vec{x}_u \rangle = \langle \vec{x}_{vv}, \vec{x}_v \rangle = -\langle \vec{x}_u, \vec{x}_{vv} \rangle$$

$$\langle \vec{x}_{uv} + \vec{x}_{vv}, \vec{x}_v \rangle = 0 \quad (6)$$

From $\langle \vec{x}_{uv} + \vec{x}_{vv}, \vec{x}_u \rangle = 0$ } and $\{\vec{x}_u, \vec{x}_v\} \in T_p(S)$
 $\langle \vec{x}_{uv} + \vec{x}_{vv}, \vec{x}_v \rangle = 0$ }
 tangent vectors.

$\vec{x}_{uv} + \vec{x}_{vv} = M \vec{N}$ for some function M

$$H = \frac{1}{2} \left(\frac{eG - 2FF + gE}{EG - F^2} \right) \text{ and isothermal parametrization } E = G, F = 0$$

$$H = \frac{1}{2} \left(\frac{e+g}{G} \right) \Rightarrow \text{by assumption } G = \langle \vec{x}_v, \vec{x}_v \rangle = \lambda^2$$

$$2\lambda^2 H = e+g \quad (*)$$

$$= \langle \vec{x}_{uv}, \vec{N} \rangle + \langle \vec{x}_{vv}, \vec{N} \rangle$$

$$= \underbrace{\langle \vec{x}_{uv} + \vec{x}_{vv}, \vec{N} \rangle}_{M \vec{N}} = M \underbrace{\langle \vec{N}, \vec{N} \rangle}_1$$

$$2\lambda^2 H = M$$

$$\text{Then } \vec{x}_{uv} + \vec{x}_{vv} = 2\lambda^2 H \vec{N}$$

5.) Show that the catenoid given by the parametrization $\vec{r}(u,v) = (a \cosh v \cos u, a \cosh v \sin u, av)$, $0 < u < 2\pi$, $|v| < \infty$ is isothermal and the catenoid is minimal.

A parametrized surface \vec{r} is called isothermal if $E=G$, $F=0$ and the coordinate system (u,v) is called isothermal coordinates on S .

$$\vec{r}_u = (-a \cosh v \sin u, a \cosh v \cos u, 0)$$

$$\vec{r}_v = (a \sinh v \cos u, a \sinh v \sin u, a)$$

$$E = a^2 \cosh^2 v \sin^2 u + a^2 \cosh^2 v \cos^2 u = a^2 \cosh^2 v$$

$$F = -a^2 \cosh v \sinh v \sin u \cos u + a^2 \cosh v \sinh v \cos u \sin u = 0$$

$$G = a^2 \sinh^2 v \cos^2 u + a^2 \sinh^2 v \sin^2 u + a^2 = a^2 \sinh^2 v + a^2 = a^2 (\sinh^2 v + 1) = a^2 \cosh^2 v$$

$$E=G, F=0 \quad \vec{r} \text{ is isothermal.}$$

$$\vec{r}_{uv} = (-a \cosh v \sin u, -a \cosh v \cos u, 0)$$

$$\vec{r}_{vv} = (a \cosh v \cos u, a \cosh v \sin u, 0)$$

$$\vec{r}_{uv} + \vec{r}_{vu} = 0$$

If $\vec{r}(u,v)$ is harmonic, then from the corollary $\vec{r}(u,v)$ is minimal.

(Corollary) \Rightarrow Let $\vec{r}(u,v)$ be isothermal. Then, \vec{r} is minimal if and only if the components of x, y, z of $\vec{r}(u,v)$ are harmonic.
